

KEY HIDING DEVICE

Abstract of the Disclosure

A key hiding device having a façade that resembles a typical sprinkler is provided. The device includes a housing having a cavity therein and a cap that detachably engages with the housing. Keys and other small items can be hidden inside the cavity in the housing. The device can be installed underground with the cap disposed substantially flush with the surface of the soil. The cap has a façade that is substantially identical to a typical pop-up sprinkler cap so that a person who is not familiar with the exact location of the device would be unable to make a quick determination as to which one of the numerous sprinkler caps is actually the key hiding device even if the person is aware of sprinkler shaped key hiding devices.
